"Agnes of the Oaks" (Plant Patent 873), one of the really TRULY FINE New Camellias, has gone to market.

This outstanding and out of the ordinary Camellia seedling was grown from a group of seed planted by Mr. Frank A. Godchaux, Sr., of Abbeville, La. The flowers are 4 3/4" to 6", clear, light to medium pink, very beautifully mottled and blotched or marbled with white showing golden yellow stamens slightly flared at the top perched atop white filaments, pink at the base, occasionally shows petaloids. The petals are of leathery texture with an unusual amount of crimping or ruffling on the topmost row.

It has three distinct types of semi-double blossoms -- the flat type, the "Adolph Audusson" type and the "Rabbit Ear" type.

At the 1950 Louisiana Camellia Society Show, where it was the talk of the show, it was the only seedling to win the Award of Merit from the American Camellia Society. "Agnes of the Oaks" has something that few Camellias have; that is, a definite and very distinct fragrance. It is a stocky, vigorous grower and is densely branched. The leaves are a dark green and slightly twisted. Even without flowers it makes a beautiful specimen. The blooming time is early to late.

The parent plant of this gorgeous new Camellia in Mr. Godchaux's beautiful garden, "The Oaks", is covered with perfect blooms, even after the "Freeze", a few being over 6" in diameter.

"Agnes of the Oaks" has won the acclaim of Camellia hobbyists and professional growers alike the country over.

Plant is being propagated and distributed under plant patent 873 by McDonald Camellia Nursery, Beech Island, Augusta, Georgia.

See Page 240 of the American Camellia Society Annual for 1950; also Page 92 of Home Gardening for the South, April 1950 issue, for further reference.
