Army Engineers Approve New Dam for Caddo Lake

The U.S. Army Corps of Engineers yesterday notified the Board of Commissioners for Rivers and Harbors that it has approved the construction of a new dam for Caddo Lake, which was recommended by the Corps in a report for the General Services Administration and the Department of the Interior.

The Corps had been working on the project for more than a year, and the new dam will be constructed near Mooringsport, Louisiana. The Corps said that the project is expected to cost $89,000,000 and will include the construction of a new dam and improvements to the existing structure.

The new dam will be 200 feet downstream from the existing dam and will have a capacity of 200,000,000 cubic feet of water. The Corps said that the new dam is necessary because the existing dam is aging and has been subject to significant wear and tear.

The Corps said that the new dam will provide a number of benefits, including increased flood control, improved water quality, and enhanced recreational opportunities. The Corps also said that the new dam will help to reduce the risk of flooding in the area and will improve water supply for the region.

The Corps said that the new dam will be constructed in two phases, with the first phase scheduled to be completed by 2022. The Corps added that the project is expected to create up to 1,000 construction jobs and will provide economic benefits to the local community.

The Corps said that the project is expected to be completed by 2024, and that the new dam will be operated and maintained by the Corps.

The Corps said that the project is expected to be funded through a combination of federal and local funding sources.

The Corps added that the project is expected to provide significant benefits to the local community, including improved water quality, increased recreational opportunities, and reduced risk of flooding.
